Examiner, Art Unit 2618

**DETAILED ACTION**

***Reasons for Allowance***

**Claims 1-10** have been cancelled.

**Claims 11-21** are allowable.

Consider **claim 11**, the best prior art of record found during the examination of the present application, **Applicant's Admitted Prior Art (hereinafter AAPA)** in view of **Mocquard et al. (US 2003/0232604 A1; hereinafter Mocquard)**, fails to specifically disclose, teach, or suggest an outside unit for receiving waves originating from a satellite, the unit comprising means of amplification and means of transposition using two transposition frequencies to transpose a satellite reception band to an intermediate frequency band of smaller size than the size of the satellite reception band, wherein the two transposition frequencies are such that a part of the satellite reception band is transposed to the intermediate frequency band in an infradyne manner by using one of the transposition frequencies and another part of the satellite reception band is transposed to the intermediate frequency band in a supradyme manner by using the other of the transposition frequencies, and in that the two transposition frequencies are chosen so that there exists an intersection common to the two parts of the band of the satellite reception band which is transposed to the intermediate frequency band with the aid of each of the two oscillators with a spectrum inverted on itself.

**Claims 12-16** are allowable because it is dependent upon independent claim 11.

Consider **claim 17**, the best prior art of record found during the examination of the present application, **Applicant's Admitted Prior Art (hereinafter AAPA)** in view of **Mocquard et al. (US 2003/0232604 A1; hereinafter Mocquard)**, fails to specifically disclose, teach, or suggest a method of receiving a radio signal originating from a satellite in a satellite reception band with the aid of an outside unit having means of amplification and means of transposition using two transposition frequencies to transpose a satellite reception band to an intermediate frequency band of smaller size than the size of the satellite reception band, wherein the satellite reception band is separated, for a given polarization, into at least four subbands of increasing frequencies and in that a part of the satellite reception band is transposed to the intermediate frequency band in an infradyne manner by using one of the transposition frequencies and another part of the satellite reception band is transposed to the intermediate frequency band in a supradyme manner by using the other of the transposition frequencies, two adjacent subbands are transposed with the aid of the two different transposition frequencies in an infradyne manner and in a supradyme manner, respectively.

**Claims 18-21** are allowable because it is dependent upon independent claim 17.
